FACTORIZING OPEN SUBSETS OF R^∞ WITH CONTROL

R. E. Heisey

In this paper we show that if U is an open subset of $R^\infty = \text{dir lim } R^n$, then the projection map $\pi: U \times R^\infty \rightarrow U$ can be approximated by homeomorphisms. One corollary of this result is that any homotopy equivalence $f: U \rightarrow V$ between open subsets of R^∞ is homotopic to a homeomorphism. A second corollary is that if $h: |K| \rightarrow |L|$ is a homotopy equivalence, where K and L are countable simplicial complexes, then $f \times \text{id}: |K| \times R^\infty \rightarrow |L| \times R^\infty$ is homotopic to a homeomorphism.

1. Background and Statement of Results

Let R denote the reals, and let $R^\infty = \varinjlim R^n$. Let M and N denote paracompact, connected R^∞ -manifolds. It is not known if M is stable, i.e. if $M \times R^\infty$ is homeomorphic to M . In [2] it is shown that (1) $M \times R^\infty$ embeds as an open subset of R^∞ , and that (2) if M and N have the same homotopy type, then $M \times R^\infty$ and $N \times R^\infty$ are homeomorphic. Thus, if it were known that R^∞ -manifolds are stable then it would follow that M embeds as an open subset of R^∞ and that if M and N have the same homotopy type then they are homeomorphic. In [4] it is shown that if U is an open subset of R^∞ then $U \times R^\infty$ is homeomorphic to U . Here we improve this result and show that there are homeomorphisms $U \times R^\infty \rightarrow U$ arbitrarily close to the projection map (Theorem 1 below). Hopefully, the techniques used here will be useful in proving stability for

general \mathbb{R}^∞ -manifolds. Note, too, that because of (1) above and Theorem 1 the existence of any homeomorphism $M \times \mathbb{R}^\infty \rightarrow M$ will now imply the existence of homeomorphisms $M \times \mathbb{R}^\infty \rightarrow M$ arbitrarily close to the projection map.

Theorem 1. *If U is an open subset of \mathbb{R}^∞ and \mathcal{V} is an open cover of U , then there is a homeomorphism $g: U \times \mathbb{R}^\infty \rightarrow U$ which is \mathcal{V} -close to the projection map $\pi: U \times \mathbb{R}^\infty \rightarrow U$.*

By g \mathcal{V} -close to π we mean that for every $(x,y) \in U \times \mathbb{R}^\infty$ there is a $V \in \mathcal{V}$ such that $\{g(x,y), x = \pi(x,y)\} \subset V$. Thus, Theorem 1 says that the projection map can be approximated by homeomorphisms. The proof of Theorem 1, given in section 3, refines the argument in [4] using some of the techniques developed in [3]. It also uses a theorem from piecewise linear (p.l.) topology which we prove in section 2 as Theorem 2. This p.l. theorem seems to be known, but we could not find a proof in the literature.

Since \mathbb{R}^∞ is locally convex, e.g. [2, Theorem IV.1], we may take the cover \mathcal{V} in Theorem 1 to consist of convex sets. Any homeomorphism $g: U \times \mathbb{R}^\infty \rightarrow U$ which is \mathcal{V} -close to π will then be homotopic to π via the straight line homotopy. Thus, we obtain the following.

Corollary 1. *For any open subset U of \mathbb{R}^∞ there is a homeomorphism $g: U \times \mathbb{R}^\infty \rightarrow U$ which is homotopic to the projection map.*

Now, let $f: U \rightarrow V$ be a homotopy equivalence where U and V are open subsets of \mathbb{R}^∞ . By [2, Theorem II.9 and Prop. III.1] there is a homeomorphism $h: U \times \mathbb{R}^\infty \rightarrow V \times \mathbb{R}^\infty$ which is

homotopic to $f \times \text{id}$. By Corollary 1 there are homeomorphisms $h_V: V \times \mathbb{R}^\infty \rightarrow V$ and $h_U: U \times \mathbb{R}^\infty \rightarrow U$, each homotopic to the corresponding projection. It follows that $h_V h_U^{-1}: U \rightarrow V$ is a homeomorphism homotopic to f . We have proved the following.

Corollary 2. Any homotopy equivalence $f: U \rightarrow V$ between open subsets of \mathbb{R}^∞ is homotopic to a homeomorphism.

With regard to Corollary 2 we remark that although (nonempty) open subsets of \mathbb{R} are not metrizable they do have the homotopy type of ANR's [2, Theorem II.10]. Thus, Corollary 2 holds as well if f is a weak homotopy equivalence.

As indicated at the end of [5], if K and L are countable simplicial complexes, then $|K| \times \mathbb{R}^\infty$ and $|L| \times \mathbb{R}^\infty$ are homeomorphic to open subsets of \mathbb{R}^∞ . Thus, as a special case of Corollary 2 we obtain the following.

Corollary 3. If K and L are countable simplicial complexes, and if $f: |K| \rightarrow |L|$ is a homotopy equivalence, then $f \times \text{id}: |K| \times \mathbb{R}^\infty \rightarrow |L| \times \mathbb{R}^\infty$ is homotopic to a homeomorphism.

2. Preliminary results

For convenience, if x is an element of a space X we will often write x for $\{x\}$. If (X, d) is a metric space, $C \subset X$ and $\epsilon > 0$, then by $B(C, \epsilon)$ we denote $\{x \in X \mid d(C, x) < \epsilon\}$. Let $I = [0, 1]$. If $H: X \times I \rightarrow Y$ is a homotopy define H_t , $t \in I$, by $H_t(x) = H(x, t)$. If $Y = X$, $H_0 = \text{id}$ and each H_t is a homeomorphism we say that H is an *ambient isotopy*. If H is also p.l. we say that H is a *p.l. ambient isotopy*.

Theorem 2. Let P be a finite polyhedron of dimension k . Let $H: P \times I \rightarrow R^n \subset R^{n+1}$, $n \geq 2k+1$, be a homotopy such that $H_0 = f$ and $H_1 = g$ are p.l. embeddings. Then given $\epsilon > 0$ there is a p.l. ambient isotopy $A: R^{n+1} \times I \rightarrow R^{n+1}$ such that (a) $A_1 f = g$ and (b) for every $x \in R^{n+1}$ either $A(x \times I) = x$ or $A(x \times I) \subset B(H(p \times I), \epsilon)$ some $p \in P$.

Proof. Let $\delta = \epsilon/6$. Define $H': P \times I \rightarrow R^{n+1}$ by $H'(p, t) = (H(p, t), t\delta)$. Let $P_0 = P \times \{0, 1\}$. Then H'/P_0 is a p.l. embedding. Let d be the usual metric on R^{n+1} . By [6, Theorem 5.4, p. 61] there is a p.l. embedding $G: P \times I \rightarrow R^{n+1}$ such that $d(G, H') < \delta$ and $G/P_0 = H'/P_0$. Note that $d(G, H) < 2\delta$ and $G_0 = f$. Let $\bar{g} = G_1 = (g, \delta)$.

Choose $\omega < \delta/2$ such that $d(x, y) < \omega$ implies $d(\bar{g}f^{-1}(x), \bar{g}f^{-1}(y)) < \delta/2$ for every $x, y \in f(P)$. Choose $\eta > 0$ such that for every $p \in P$

i) $\text{diam}(G(p \times [0, \eta])) < \omega/2$ and

ii) $\text{diam}(G(p \times [1-\eta, 1])) < \omega/2$.

Choose $\gamma > 0$ such that $\gamma < \omega$ and (1) $d(G(P \times [\eta, 1]), G_0(P)) > \gamma$ and (2) $d(G(P \times [0, 1-\eta]), G_1(P)) > \gamma$. Let $U = \frac{\gamma}{2}$ -neighborhood of $G_1(P)$. By an engulfing theorem of Bing [1, Theorem B, p. 8] (taking $L = \phi$, $C = G_1(P)$ in the notation of [1]) there is a p.l. ambient isotopy $F: R^{n+1} \times I \rightarrow R^{n+1}$ such that $F/(G_1(P) \times I) = \text{id}$, for every $x \in R^{n+1}$ either $F(x \times I) = x$ or $F(x \times I) \subset B(G(p \times I), \gamma/2)$ some $p \in P$, and $G(P \times I) \subset F_1(U)$. Define $E: R^{n+1} \times I \rightarrow R^{n+1}$ by $E(x, t) = F_{1-t}^{-1} F_1^{-1}(x)$. Then E is a p.l. ambient isotopy with the same properties as F except that the last condition becomes $E_1(G(P \times I)) \subset U$.

We proceed to show that $d(E_1 f, g) < 2\delta$. For $p \in P$

choose $\theta(p) \in P$ as follows. If $F(f(p) \times I) = f(p)$ take $\theta(p) = p$. Otherwise take $\theta(p) = q$ where q is any point P such that $E(f(p) \times I) \subset B(G(q \times I), \gamma/2)$. Then, in either case, $E(f(p) \times I) \subset B(G(\theta(p) \times I), \gamma/2)$. Since $f(p) = E_0 f(p) \in B(G(\theta(p) \times I), \gamma/2)$ there is a $t_0 \in I$ such that $d(f(p) = G_0(p), G(\theta(p), t_0)) < \gamma/2$. By (1) and then (i) above it follows that $t_0 < \eta$ and $d(G(\theta(p), t_0), G_0(\theta(p)) = f(\theta(p))) < \omega/2$. Thus $d(f(p), f(\theta(p))) < \gamma/2 + \omega/2 < \omega$ so that, by choice of ω , $d(\bar{g}(p), \bar{g}(\theta(p))) < \delta/2$. Choose $t_1 \in I$ such that $d(E_1 f(p), G(\theta(p), t_1)) < \gamma/2$. Then, since $E_1(G(P \times I)) \subset U$, $d(G(\theta(p), t_1), G_1(P)) < \gamma$. Applying (2) and then (ii) above we obtain $t_1 > 1 - \eta$ and $d(G(\theta(p), t_1), G_1(\theta(p)) = \bar{g}(\theta(p))) < \omega/2$. Thus $d(E_1 f(p), \bar{g}(\theta(p))) < \gamma/2 + \omega/2 < \omega$, and $d(E_1 f(p), \bar{g}(p)) \leq d(E_1 f(p), \bar{g}(\theta(p))) + d(\bar{g}(\theta(p)), \bar{g}(p)) < \omega + \delta/2 < \delta$. Therefore, $d(E_1 f, g) < 2\delta$.

By the unknotting theorem in [7, p. 111] (with $P = L$) there is a p.l. ambient isotopy $F: R^{n+1} \times I \rightarrow R^{n+1}$ such that $F_1 E_1 f = g$, $\text{diam}(F(x \times I)) < 2\delta$ for every x , and $F(x \times I) = x$ for every x such that $d(x, E_1 f(p)) \geq 2\delta$. Define $A: R^{n+1} \times I \rightarrow R^{n+1}$ by $A_t = F_t E_t$. Then A is a p.l. ambient isotopy satisfying the conclusion of the theorem. To see that (b) holds in the case where $E(x \times I) = x$ and $F(x \times I) \neq x$, note first that $d(x, E_1 f(p)) < 2\delta$. Thus, $d(x, g(p) = H_1(p)) < 4\delta$ so that $A(x \times I) \subset B(H(p \times I), 6\delta = \epsilon)$ as required.

3. Proof of Theorem 1

In addition to the notation introduced at the beginning of section 2 we will use the following. If $H: X \times I \rightarrow Y$ is a homotopy and \mathcal{G} is an open cover of Y we say that H is

limited by \mathcal{G} if for each $x \in X$, $H(x \times I) \subset G$, some $G \in \mathcal{G}$. If \mathcal{G} is an open cover of Y and X is any space then $X \times \mathcal{G} = \{X \times G \mid G \in \mathcal{G}\}$. If \mathcal{G} is an open cover of Y and $A \subset Y$ then $A \cap \mathcal{G} = \{A \cap G \mid G \in \mathcal{G}\}$. We use d_k to denote the usual metric on \mathbb{R}^k . If $A \subset \mathbb{R}^k$ we denote by $\text{Int}_k A$ the topological interior of A in \mathbb{R}^k , and, for $\varepsilon > 0$, we denote by $B^k(A, \varepsilon)$ the set $\{x \in \mathbb{R}^k \mid d_k(A, x) < \varepsilon\}$. We identify \mathbb{R}^n with $\mathbb{R}^n \times \{0\} \subset \mathbb{R}^{n+1}$. In this way $\mathbb{R}^\infty = \cup\{\mathbb{R}^n \mid n = 1, 2, 3, \dots\}$. If $X \subset \mathbb{R}^\infty$ we let $X^n = X \cap \mathbb{R}^n$.

We will need two lemmas. The proof of the first is straightforward, and we omit the proof. Lemma 2 is proved in [3].

Lemma 1. Let C be a compact subset of a locally compact metric space (X, d) . Let \mathcal{G} be a collection of open subsets of X whose union contains C . Then there is an $\varepsilon > 0$ such that for each $x \in C$, $B(x, \varepsilon) \subset G$ some $G \in \mathcal{G}$.

Lemma 2. [3, Lemma 4]. Let $H: X \times I \rightarrow Y$ be a homotopy where X is a compact metric space and Y is a metric space. Let \mathcal{G} be an open cover of Y such that H is limited by \mathcal{G} . Then there is an $\varepsilon > 0$ such that for every $x \in X$ there is a $G \in \mathcal{G}$ such that $B(H(x \times I), \varepsilon) \subset G$.

Proof of Theorem 1. For convenience, we may assume that U is connected. Using elementary reasoning (e.g. see [2, Prop. III.1 and Prop. III.2]), $U = \cup\{C_n \mid n = 4, 5, 6, 7, \dots\}$ where $C_n \subset \mathbb{R}^n$ is compact, $C_n \subset C_{n+1}$, and where a subset G of U is open in U iff $G \cap C_n$ is open in C_n , $n \geq 4$. In what follows "manifold" will be used only for a compact, p.1.

manifold, possibly with boundary. We observe that if K is any compact set and $K \subset W$ where W is open in \mathbb{R}^n , then there is an n -manifold M such that $K \subset \text{Int}_W M \subset M \subset W$. Given $\epsilon > 0$ and $n \geq 2$, let $D(n, \epsilon) = \{x = (x_1, \dots, x_n) \mid x \in \mathbb{R}^n \text{ and } |x_i| \leq \epsilon, i = 1, 2, \dots, n\}$.

Choose a 4-dimensional manifold M_2 such that $C_4 \subset M_4 \subset U^4$. By Lemma 1 there is an $\epsilon_2 > 0$ such that for every $x \in M_2$, $B^8(x, 2\epsilon_2) \subset V^8$, some $V \in \mathcal{V}$. Choose a manifold M_3 of dimension 8 such that $[M_2 \times D(2, \epsilon_2)] \cup C_8 \subset \text{Int}_8 M_3 \subset M_3 \subset U^8$. Choose $\rho_2 > 0$ such that $\rho_2 < \text{mim}\{1, d_8(M_2 \times E_2, \mathbb{R}^\infty \setminus \text{Int}_8 M_3)\}$. Let $E_2 = D(2, \epsilon_2)$ and $F_2 = D(2, 2)$. Define a p.l. homeomorphism $h_2: M_2 \times E_2 \rightarrow M_2 \times F_2$ by $h_2(m, e) = (m, (2/\epsilon_2)e)$. Let $F_3 = D(6, 3)$, and define $i_2: M_2 \times E_2 \rightarrow M_3 \times F_3$ by $i_2(m, e) = ((m, e), 0)$ and $\beta_2: M_2 \times F_2 \rightarrow M_3 \times F_3$ by $\beta_2(m, f) = ((m, 0), (f, 0))$. Define $H_2: M_2 \times E_2 \times I \rightarrow M_3 \times F_3$ by $H_2(m, e, t) = \{((m, (1-2t)e), 0), t \in [0, 1/2], ((m, 0), ((2/\epsilon_2)e, 0)), t \in [1/2, 1]\}$. Then, regarding H_2 as a map into $U^8 \times \mathbb{R}^6$, H_2 is limited by $\mathcal{V}^8 \times \mathbb{R}^6$. By Theorem 2 there is a p.l. ambient isotopy $A_3: \mathbb{R}^{14} \times I \rightarrow \mathbb{R}^{14}$ such that $(A_3)_1 i_2 = \beta_2 h_2$ and such that for every $x \in \mathbb{R}^{14}$ either $A_3(x \times I) = x$ or $A_3(x \times I) \subset B^{14}(H_2((m, e) \times I), \delta_3)$ some $(m, e) \in M_2 \times E_2$. It follows that $(A_3)_t(M_3 \times F_3) = M_3 \times F_3$. Thus, we may regard A_3 as a p.l. ambient isotopy $A_3: M_3 \times F_3 \times I \rightarrow M_3 \times F_3$. As such A_3 is limited by $(M_3 \times F_3) \cap (\mathcal{V}^8 \times \mathbb{R}^6)$. Set $g_2 = h_2$.

Suppose, inductively, that for $n \geq 3$ we have defined $M_k, F_k, 2 \leq k \leq n; E_{k-1}, \beta_{k-1}: M_{k-1} \times F_{k-1} \rightarrow M_k \times F_k, g_{k-1}: M_{k-1} \times E_{k-1} \rightarrow M_{k-1} \times F_{k-1}, i_{k-1}: M_{k-1} \times E_{k-1} \rightarrow M_k \times F_k, 3 \leq k \leq n; A_n: M_n \times F_n \times I \rightarrow M_n \times F_n$; and $\alpha_{k-2}: M_{k-2} \times E_{k-2} \rightarrow M_{k-1} \times E_{k-1}, 3 \leq k \leq n$, (the condition on the α 's being only

for $n > 3$) such that M_k is a 2^k -dimensional manifold in U^{2^k} , $(M_{k-1} \times E_{k-1}) \cup C_{2^k} \subset \text{Int}_{2^k} M_k$, $F_k = D(2^{k-2}, k)$, $\beta_{k-1}(m, f) = ((m, 0), (f, 0))$, $i_{k-1}(m, e) = ((m, e), 0)$, g_{k-1} is a p.l. homeomorphism, $g_{k-1} \alpha_{k-2} = \beta_{k-2} g_{k-2}$ (this condition, again, only for $n > 3$), and such that A_n is a p.l. ambient isotopy limited by $(M_n \times F_n) \cap (V^{2^n} \times R^{2^{n-2}})$ with $(A_n)_1 i_{n-1} = \beta_{n-1} g_{n-1}$.

We proceed to construct M_{n+1} , F_{n+1} , E_n , β_n , g_n , α_{n-1} , i_n and A_{n+1} satisfying analogous conditions. Define $\beta_n: M_n \times F_n \rightarrow U^{2^{n+1}} \times R^{2^{n+1}-2}$ by $\beta_n(m, f) = ((m, 0), (f, 0))$. Then $\beta_n A_n$ is limited by $V^{2^{n+1}} \times R^{2^{n+1}-2}$. By Lemma 2 there is a $\gamma_n > 0$ such that for every $x \in M_n \times F_n$, $B^{2^{n+2}-2}(\beta_n A_n(x \times I), \gamma_n) \subset V^{2^{n+1}} \times R^{2^{n+1}-2}$. Choose $\epsilon_n > 0$ such that $\epsilon_n < \gamma_n$ and such that $M_n \times D(2^{n-2}, \epsilon_n) \subset U^{2^{n+1}-2}$. Let $E_n = D(2^{n-2}, \epsilon_n)$. Choose manifold M_{n+1} of dimension 2^{n+1} such that $[(M_n \times E_n) \cup C_{2^{n+1}}] \subset \text{Int}_{2^{n+1}} M_{n+1} \subset M_{n+1} \subset U^{2^{n+1}}$. Choose $\rho_n > 0$ such that $\rho_n < \text{mim}\{1, d_{2^{n+1}}(M_n \times E_n, R^\infty \setminus \text{Int}_{2^{n+1}} M_{n+1})\}$. Let $F_{n+1} = D(2^{n+1}-2, n+1)$. Define a p.l. homeomorphism $h_n: M_n \times E_n \rightarrow M_n \times F_n$ by $h_n(m, e) = (m, (n/\epsilon_n)e)$. Define $i_n: M_n \times E_n \rightarrow M_{n+1} \times F_{n+1}$, and $\alpha_{n-1}: M_{n-1} \times E_{n-1} \rightarrow M_n \times E_n$ by $i_n(m, e) = ((m, e), 0)$ and $\alpha_{n-1}(m, e) = ((m, e), 0)$. Note that $\beta_n(M_n \times E_n) \subset M_{n+1} \times F_{n+1}$ and consider the following diagram.

Let $g_n = (A_n)_1 h_n$. Then g_n is a p.l. homeomorphism, and $g_n \alpha_{n-1} = (A_n)_1 \beta_{n-1} = \beta_{n-1} g_{n-1}$. Define $H_n: M_n \times E_n \times I \rightarrow M_{n+1} \times F_{n+1}$ by

$$H_n(m, e, t) = \left\{ \begin{array}{l} ((m, (1-4t)e), 0), t \in [0, 1/4] \\ ((m, 0), ([n(4t-1)/\epsilon_n]e, 0)), t \in [1/4, 1/2] \\ \beta_n A_n(h_n(m, e), 2t-1), t \in [1/2, 1]. \end{array} \right\}$$

Then H_n is a homotopy between the p.l. embeddings i_n and $\beta_n g_n$. Also, if $\pi_{n+1}: M_{n+1} \times F_{n+1} \rightarrow M_{n+1}$ is the projection, then $\pi_{n+1} H_n(x \times I)$ is contained in the γ_n -neighborhood of $\pi_{n+1} \beta_n A_n(h_n(x) \times I)$. Thus, by choice of γ_n , H_n is limited by $(M_{n+1} \times F_{n+1}) \cap (V^{2^{n+1}} \times R^{2^{n+1}-2})$. By Lemma 2 there is a $\delta_{n+1} > 0$ such that $\delta_{n+1} \leq \rho_n$ and such that for every $x \in M_n \times E_n$, $B^{2^{n+2}-2}(H_n(x \times I), \delta_{n+1}) \subset V^{2^{n+1}} \times R^{2^{n+1}-2}$, some $v \in V$. By Theorem 2 there is a p.l. ambient isotopy $A_{n+1}: R^{2^{n+2}-2} \times I \rightarrow R^{2^{n+2}-2}$ such that $(A_{n+1})_1 i_n = \beta_n g_n$ and such that for every $x \in R^{2^{n+2}-2}$ either $A_{n+1}(x \times I) = x$ or $A_{n+1}(x \times I) \subset B^{2^{n+2}-2}(H_n(m, e) \times I, \delta_{n+1})$ some $(m, e) \in M_n \times E_n$. It follows that $(A_{n+1})_t$ is the identity off $M_{n+1} \times F_{n+1}$, $t \in I$. Thus, we may regard A_{n+1} as a p.l. ambient isotopy $A_{n+1}: M_{n+1} \times F_{n+1} \times I \rightarrow M_{n+1} \times F_{n+1}$. As such, A_{n+1} is limited by $(M_{n+1} \times F_{n+1}) \cap (V^{2^{n+1}} \times R^{2^{n+2}-2})$. This completes the inductive step.

By induction we have $\alpha_n, \beta_n, g_n, n \geq 2$, such that the following diagram commutes for every n .

$$\begin{array}{ccc} M_n \times E_n & \xrightarrow{\alpha_n} & M_{n+1} \times E_{n+1} \\ \downarrow g_n & & \downarrow g_{n+1} \\ M_n \times F_n & \xrightarrow{\beta_n} & M_{n+1} \times F_{n+1} \end{array}$$

The g_n 's induce a homeomorphism of direct limits,

$$g_\infty: \text{dir lim}\{M_n \times E_n; \alpha_n\} \rightarrow \text{dir lim}\{M_n \times F_n; \beta_n\}.$$

As shown in [4, p. 379] $\text{dir lim}\{M_n \times E_n; \alpha_n\}$ is homeomorphic to U and $\text{dir lim}\{M_n \times F_n; \beta_n\}$ is homeomorphic to $U \times \mathbb{R}^\infty$.

Thus, $(g_\infty)^{-1}$ induces a homeomorphism $g: U \times \mathbb{R}^\infty \rightarrow U$. To see

that g is \mathcal{V} -close to π , let $(m, x) \in U \times \mathbb{R}^\infty$. Then $y =$

$g(m, x) \in M_n$, some n , and $(m, x) = g_\infty(y) = g_n(y, 0) \equiv \beta_n g_n(y, 0) =$

$((m, 0), (x, 0))$. Since $\{(A_{n+1})_1 i_n((y, 0)) = \beta_n g_n((y, 0)) =$

$((m, 0), (x, 0)), (A_{n+1})_0 i_n((y, 0)) = ((y, 0), 0)\} \subset V^{2^{n+1}} \times$
 $\mathbb{R}^{2^{n+1}-2}$ some $V \in \mathcal{V}$, we have $\{(m, 0), (y, 0)\} \subset V^{2^{n+1}}$, some

$V \in \mathcal{V}$, as required. The proof is now complete.
