## SHORE AND CENTER POINTS OF A CONTINUUM

ROCÍO LEONEL

**ABSTRACT.** We consider shore points, strong center points, and center points not only in  $\lambda$ -dendroids but in any non-degenerate continuum, and we present some relations between them. We give some conditions to show when a continuum is an arvom continuum, and also we give some conditions to show when, for a closed subset  $A$  of a continuum  $X$ ,  $T(A)$  is a shore set of  $X$ .

### 1. PRELIMINARIES

A *continuum* is a nonempty, compact, connected metric space. A *subcontinuum* of a continuum  $X$  is a continuum contained in  $X$ .

For a continuum  $X$ ,  $C(X) = \{A \subset X : A \text{ is a subcontinuum of } X\}$ . It is known that  $C(X)$  with the topology induced by the Hausdorff metric is a continuum [6, p. 52, Theorem 4.2].

A nonempty subset  $A$  of a continuum  $X$  is a *shore set* if, for every  $\varepsilon > 0$ , there is a subcontinuum  $C$  of  $X$  such that  $A \cap C = \emptyset$  and  $H(X, C) < \varepsilon$ , with  $H$  the Hausdorff metric.

In particular, when  $A = \{p\} \subset X$ , and  $A$  is a shore set, we say that the point  $p$  is a *shore point* of  $X$ .

It is easy to see that in an interval, end points are shore points, every point of a Knaster continuum is a shore point, and every subcontinua of a Knaster continuum is a shore set.

A point  $p$  of a continuum  $X$  is a *cut point* if  $X \setminus \{p\}$  is not connected.

It is clear that if  $p$  is a shore point of a continuum  $X$ , then  $p$  is not a cut point of  $X$ . The converse is not always true. Take two harmonic fans  $A_1$  and  $A_2$  such that  $A_1 \cap A_2 = \{v_2\}$  and  $v_2$  is the vertex in  $A_2$  but in

$A_1$ , the point  $v_2$  is the end point of the limit arc and  $v_2v$  is the limit arc in  $A_2$ . If we take a point  $p \in v_2v$ , then  $p$  is a shore point, but  $p$  is not a cut point.

A point  $p$  of a continuum  $X$  is a *center point* if there are two points  $a$  and  $b$  in  $X$ , such that for every  $\varepsilon > 0$  there is a subcontinuum  $C$  of  $X$  containing  $p$  and  $\text{diam}(C) < \varepsilon$  and there are open sets  $U$  and  $V$  containing  $a$  and  $b$ , respectively, such that every arc in  $X$  from  $U$  to  $V$  intersects  $C$ .

If  $p$  is a center point with respect to the points  $a$  and  $b$ , we say that  $p$  is an *ab-center*.

A point  $p$  of a continuum  $X$  is a *strong center point* if there are open sets  $U$  and  $V$  such that every arc in  $X$  from  $U$  to  $V$  contains  $p$ .

The definition of center is due to Piotr Minc who proved that every dendroid has at least one center [4, Theorem 3.6]. It is clear from the definition that every point that is a strong center point is a center point. The converse is not always true [7, Example 1].

In some cases we only use shore (center, strong center, cut) instead of shore point (center, strong center, cut) of  $X$ .

We define an *arvum continuum* as a continuum for which every point is a shore point.

The Knaster continuum is an arvum continuum.

## 2. SHORE, CUT, CENTER, AND STRONG CENTER POINTS

In this section, we present some relationships between center, strong center, cut, and shore points. We prove that in every continuum a cut point is always a center point and strong center point, and it is not a shore point.

A center point is not necessarily a cut point. So we show that if a continuum  $X$  is locally connected, then every center point is a cut point and strong center point, and, in this case, the set of the center points and the set of the shore points are disjoint.

**Proposition 2.1.** *Let  $X$  be a continuum and let  $p$  be a cut point of  $X$ . Then*

- (1)  $p$  is a strong center and, by a consequence,  $p$  is a center;
- (2)  $p$  is not a shore point.

*Proof.* If  $p$  is a cut point, then  $X \setminus \{p\} = M \cup K$ , where  $M$  and  $K$  are open, not empty, and disjoint subsets of  $X$ .

(1) Let  $a \in M$  and let  $b \in K$ . If there is an arc  $\alpha$  from  $M$  to  $K$ , then  $p \in \alpha$ ; in the other way,  $\alpha \subset X \setminus \{p\}$  and  $M \cap K \neq \emptyset$ , a contradiction. Therefore,  $p$  is a strong center and, as a consequence,  $p$  is a center.

(2) It is clear that  $M \cup \{p\}$  and  $K \cup \{p\}$  are subcontinua of  $X$ . Let  $\varepsilon_1 = H(M \cup \{p\}, K \cup \{p\})$  and  $\varepsilon = \frac{\varepsilon_1}{4}$ . If there is a subcontinuum  $B$  of  $X$  such that  $H(X, B) < \varepsilon$ , then  $p \in B$ ; otherwise, by using that  $B$  is connected, we have that either  $B \subset M$  or  $B \subset K$ . So,  $H(X, B) > \varepsilon$ , a contradiction. Therefore,  $p$  is not a shore point.  $\square$

From the previous proposition, we obtain the following corollary.

**Corollary 2.2.** *Let  $X$  be a continuum. If  $X$  has a cut point, then  $X$  has at least one strong center point.*

It is not always true that every strong center point is a cut point; the Warsaw circle has points that are strong center points but no cut points, but if we add the hypothesis of local connectedness, then it is true.

**Theorem 2.3.** *Let  $X$  be a locally connected continuum. Then the following conditions are equivalent:*

- (1)  $p$  is not a shore point;
- (2)  $p$  is a cut point;
- (3)  $p$  is a strong center point;
- (4)  $p$  is a center point.

*Proof.* (1) implies (2). We suppose that  $p$  is not a cut point and we show that  $p$  is a shore point.

Let  $\varepsilon > 0$  and  $p \in X$ . Since  $p$  is not a cut point of  $X$ ,  $X \setminus \{p\}$  is connected. Then there is a subcontinuum  $C$  of  $X$  such that  $p \notin C$  and  $H(C, X) < \varepsilon$  [6, p. 137, Exercise 8.45]. Therefore,  $p$  is a shore point.

By using Proposition 2.1, (2) implies (1), and (2) implies (3), and (3) implies (4) are clear.

(4) implies (3). Let  $p$  be an  $ab$ -center and  $\varepsilon > 0$ . Then there is  $C$  in  $C(X)$  and open subsets  $U$  and  $V$  of  $X$  such that  $p \in C$ ,  $\text{diam}(C) < \varepsilon$ ,  $a \in U$ ,  $b \in V$ ,  $C \cap U = \emptyset = C \cap V$ , and every arc from  $U$  to  $V$  intersects  $C$ .

Let  $U'$  and  $V'$  be open connected subsets of  $X$  such that  $a \in U' \subset U$  and  $b \in V' \subset V$ .

Every arc from  $a$  to  $b$  contains  $p$ . To see this, we suppose that there is an arc  $L$  from  $a$  to  $b$  such that  $p \notin L$ .

Let  $r = d(L, \{p\})$  and  $\varepsilon_1 = \frac{r}{4}$ . If there is  $B \in C(X)$  such that  $p \in B$  and  $\text{diam}(B) < \varepsilon_1$ , since  $C \cap U = \emptyset = C \cap V$ , then  $B \cap L = \emptyset$ , which is a contradiction.

Now, we see that every arc from  $U'$  to  $V'$  contains  $p$ . Let  $uv$  be an arc from  $U'$  to  $V'$ . By using [6, p. 132, Theorem 8.26],  $U'$  is arcwise connected, then there is an arc from  $a$  to  $u$  contained in  $U'$ ; we denote this arc by  $au$ . In the same way, there is an arc  $vb$  in  $V'$  from  $v$  to  $b$ .

We consider  $L'$  as the union of the arcs  $au$ ,  $uv$ , and  $vb$ ; then  $L'$  is an arc from  $a$  to  $b$ . This implies that  $p \in L'$ . Then  $p \in C \cap U$  or  $p \in C \cap V$ , a contradiction. Therefore,  $p \in uv$ .

(3) implies (2). We suppose that  $p$  is not a cut point and we show that  $p$  is not a strong center point.

Since  $p$  is not a cut point, by [6, p. 132, Theorem 8.26],  $X \setminus \{p\}$  is arcwise connected, so  $p$  is not a strong center point.  $\square$

## 2.1. SHORE AND CENTER POINTS IN AN ARCWISE CONNECTED CONTINUUM.

Jo Heath and Van C. Nall in [1, §4] define for a dendroid  $D$  and  $x, y \in D$  the set  $Q_x(y) = \{z \in D : y \in zx\}$ .

Let  $X$  be an arcwise connected continuum; we define for every two points  $z, y \in X$ ,  $Q_z(y) = \{x \in X : y \in zx \text{ for some arc } zx\}$ .

It is not difficult to see that the set  $Q_z(y)$  is not empty,  $y \in Q_z(y)$ , and  $Q_z(y)$  is arcwise connected.

The following lemma was proved by Nall for dendroids [7, Lemma 4]. Our proof is similar to Nall's proof.

**Lemma 2.4.** *Let  $X$  be a continuum. If  $A$  is a proper subset of  $X$  such that  $X \setminus A$  is arcwise connected, then  $A$  is a shore set of  $X$  if and only if  $\text{Int}(A) = \emptyset$ .*

*Proof.* If  $A$  is a shore set, it follows by the definition that  $\text{Int}(A) = \emptyset$ . Now we assume that  $X \setminus A$  is arcwise connected and  $\text{Int}(A) = \emptyset$ . Let  $\varepsilon > 0$  and let  $D_1, D_2, D_3, \dots, D_n$  be open and nonempty subsets of  $X$  such that  $X \subset \bigcup_{i=1}^n D_i$  and  $\text{diam}(D_i) < \frac{\varepsilon}{4}$ .

Since  $\text{Int}(A) = \emptyset$ , let  $y \in X \setminus A$  and  $d_i \in D_i \setminus A$  such that  $yd_i = \alpha_i$  is an arc from  $y$  to  $d_i$  for each  $i \in \{1, 2, 3, \dots, n\}$ . We consider  $D = \bigcup_{i=1}^n \alpha_i$ .  $D$  is a subcontinuum of  $X$  such that  $D \cap A = \emptyset$  and  $H(D, X) < \varepsilon$ . Therefore,  $A$  is a shore set.  $\square$

Nall [7, Theorem 1] showed that, for every dendroid  $D$ , if  $p$  is a strong center point of  $X$ , then  $p$  is not a shore point; we see that it is always true for every arcwise connected continuum.

**Theorem 2.5.** *Let  $X$  be an arcwise connected continuum. Then every point which is not a center point is a shore point.*

*Proof.* Let  $p \in X$  such that  $p$  is not a center point, then  $p$  is not a strong center point. We consider two cases: first, when  $X \setminus \{p\}$  is arcwise connected and second, when  $X \setminus \{p\}$  is not arcwise connected.

Case 1:  $X \setminus \{p\}$  is an arcwise connected set.

Since  $\text{Int}(\{p\}) = \emptyset$  and  $X \setminus \{p\}$  is arcwise connected, then by Lemma 2.4,  $p$  is a shore point.

Case 2:  $X \setminus \{p\}$  is not an arcwise connected set.

For every  $y \in X \setminus \{p\}$ , we denote by  $A_y$  the arcwise component in  $X \setminus \{p\}$  that contains  $y$ .

Now, if there is  $y \in X \setminus \{p\}$  such that  $A_y$  is a dense subset of  $X$ , then  $p$  is a shore point.

We suppose that  $X \setminus \overline{A_y} \neq \emptyset$  for each  $y \in X \setminus \{p\}$  and there is  $y \in X \setminus \{p\}$  such that  $\text{Int}(A_y) \neq \emptyset$ . Let  $U$  be an open subset in  $X$  such that  $U \subset A_y$  and let  $V$  be an open subset of  $X$  such that  $V \subset X \setminus \overline{A_y}$ , then  $V \cap A_y = \emptyset$ .

We affirm that every arc from  $V$  to  $U$  contains  $p$ .

Let  $\alpha = vu$  be an arc from  $V$  to  $U$  and  $p \in \alpha$ . Since  $u \in A_y$ , let  $\beta$  be an arc from  $u$  to  $y$  contained in  $A_y$ . Then  $\alpha \cup \beta$  is an arc from  $v$  to  $y$  such that  $p \notin \alpha \cup \beta$ ; this implies that  $v \in A_y$ . So,  $p$  is a strong center, a contradiction. Then for every  $y \in X \setminus \{p\}$ , we have that  $\text{Int}(A_y) = \emptyset$ . Then  $p$  is a shore point.  $\square$

We observe that in the previous theorem it is necessary that  $X$  be an arcwise connected continuum. As an example, we take a simple closed curve and two rays that converge to the simple closed curve, one in the interior and the other outside.

## 2.2. SHORE SETS.

It is always true that if  $T(A)$  is a shore set of a continuum  $X$ , then  $A$  is a shore set of  $X$ . The converse is not always true; for example, in the Knaster continuum for every point  $p$ ,  $\{p\}$  is a shore set, but  $T(\{p\}) = \text{Knaster}$ .

We want to know when, for a given closed subset  $A$  of a dendroid  $D$ ,  $T(A)$  is a shore set of  $D$ . First, we give some definitions about the function  $T$ .

Given a compactum  $X$ , the *power set of  $X$* , denoted by  $\mathcal{P}(X)$ , is  $\mathcal{P}(X) = \{A : A \subset X\}$ .

Let  $X$  be a compactum. Defined  $T : \mathcal{P}(X) \rightarrow \mathcal{P}(X)$  by  $T(A) = \{x \in X : \text{for each subcontinuum } W \text{ of } X \text{ such that } x \in \text{Int}(W), \text{ we have that } W \cap A \neq \emptyset\}$ , for each  $A \in \mathcal{P}(X)$ . The function  $T$  is called Jones's set function  $T$ .

It is known that for each compactum  $X$  and  $A \in \mathcal{P}(X)$ ,  $T(A)$  is a closed subset of  $X$ , and if  $X$  is a continuum and  $A$  is a subcontinuum of  $X$ , then  $T(A)$  is a subcontinuum of  $X$  [3, p. 149, Theorem 3.1.21].

A continuum  $X$  is  *$T$ -additive* if, for each pair  $A$  and  $B$  of closed subsets of  $X$ ,  $T(A \cup B) = T(A) \cup T(B)$ .

If  $D$  is a dendroid, we denote by  $C_e(D) = \{z \in D : z \text{ is a center of } D\}$ . Minc proved that for every dendroid  $D$ ,  $C_e(D) \neq \emptyset$  [4, Theorem 3.6].

For every two points  $x, y \in D$ , we denote by  $xy$  the arc from  $x$  to  $y$  in  $D$ .

**Proposition 2.6.** *Let  $X$  be an aposyndetic continuum. If  $X$  is  $T$ -additive and  $A$  is a closed shore set of  $X$ , then  $T(A)$  is a shore set of  $X$ .*

*Proof.* Since  $X$  is aposyndetic and  $T$ -additive,  $X$  is locally connected [3, p. 161, Theorem 3.1.47]. This implies that  $T(A) = A$  [3, p. 153, Theorem 3.1.31]. Therefore,  $T(A)$  is a shore set of  $X$ .  $\square$

**Corollary 2.7.** *Let  $D$  be a dendroid and let  $A$  be a closed shore set of  $D$ . If  $D$  is aposyndetic, then  $T(A)$  is a shore set of  $D$ .*

*Proof.* Every dendroid  $D$  is  $T$ -additive [3, p. 160, Theorem 3.1.45].  $\square$

**Proposition 2.8.** *Let  $D$  be a dendroid, let  $p$  be a center of  $D$ , and let  $A$  be a closed subset of  $D$ . If  $T(A) \subset Q_p(y)$  for some  $y \in T(A)$  and  $T(A) \cap C_e(D) = \emptyset$ , then  $T(A)$  is a shore set of  $D$ .*

*Proof.* Let  $p$  be a center of  $D$ , let  $A$  be a closed subset of  $D$ , and let  $y \in T(A)$  such that  $T(A) \subset Q_p(y)$ . Since  $y \in T(A)$ ,  $T(A) \cap C_e(D) = \emptyset$  and, by using [7, Lemma 1], we have that  $\text{Int}(Q_p(y)) = \emptyset$ . It is easy to see that  $D \setminus Q_p(y)$  is arcwise connected. Then, by Lemma 2.4,  $Q_p(y)$  is a shore set of  $D$ . Hence,  $T(A) \subset Q_p(y)$  and  $T(A)$  is a shore set of  $D$ .  $\square$

**Theorem 2.9.** *Let  $D$  be a dendroid and let  $A$  be a closed subset of  $D$  such that  $A \cap C_e(D) = \emptyset$  and  $A$  has at most a finite number of components. Then  $A$  is a shore set of  $D$ .*

*Proof.* Let  $p \in D$  be a center point and  $K_1, K_2, \dots, K_n$  be the components of  $A$ .

Since  $D$  is hereditarily arcwise connected, then, for each  $i \in \{1, 2, \dots, n\}$ , there is a unique  $y_i \in K_i$  such that  $K_i \subset Q_p(y_i)$ .

Since  $A \cap C_e(D) = \emptyset$  and, by [7, Theorem 1], for every  $a \in A$ ,  $a$  is not a strong center point, then, by [7, Lemma 1], we have that  $\text{Int}(Q_p(y_i)) = \emptyset$ , so  $\text{Int}(K_i) = \emptyset$ . Then, by Lemma 2.4,  $Q_p(y_i)$  is a shore set of  $D$ . Then  $K_i$  is a shore set of  $D$ . By using [2, Theorem 3],  $A$  is a shore set of  $D$ .  $\square$

In the previous theorem, it is necessary that  $A \cap C_e(D) = \emptyset$  and  $A$  has at most a finite number of components. We present two examples to see it.

**Example 2.10.** Let  $F$  be the harmonic fan with vertex in  $u = (0, 0)$  and the end points  $(1, \frac{1}{n})$   $n \in \mathbb{N}$  with limit arc  $uv, v = (1, 0)$ . We consider  $A = uv$ ; then  $A \cap C_e(D) \neq \emptyset$  and  $A$  is not a shore set of  $D$ .

**Example 2.11.** We take  $D$  to be the Cantor fan and let  $A = \text{Cantor set} \times \{\frac{1}{2}\}$ , so  $A \cap C_e(D) = \emptyset$ ,  $A$  has uncountable many components, and  $A$  is not a shore set of  $D$ .

By Theorem 2.9, it is easy to prove the following propositions.

**Proposition 2.12.** *Let  $D$  be a dendroid and let  $A$  be a closed subset of  $D$  such that  $T(A) \cap C_e(D) = \emptyset$  and  $T(A)$  has at most a finite number of components. Then  $T(A)$  is a shore set of  $D$ .*

**Proposition 2.13.** *Let  $D$  be a dendroid and let  $A$  be a closed subset of  $D$ . If  $T(A)$  is connected and  $T(A) \cap C_e(D) = \emptyset$ , then  $T(A)$  is a shore set of  $D$ .*

**Corollary 2.14.** *Let  $D$  be a dendroid and let  $A$  be a shore continua of  $D$ . If  $T(A) \cap C_e(D) = \emptyset$ , then  $T(A)$  is a shore set of  $D$ .*

### 3. ARVUM CONTINUA

In this section, we show that every indecomposable continuum is an arvum continuum and give some conditions for a continuum to be an arvum continuum.

We remember that an arvum continuum is as a continuum for which every point is a shore point. The Knaster continuum and the Warsaw circle are examples of arvum continua.

**Proposition 3.1.** *If  $X$  is an indecomposable continuum, then  $X$  is an arvum continuum.*

*Proof.* Let  $x \in X$ . We denote by  $k(x)$  the composant from  $x$  in  $X$  and let  $y \in X \setminus k(x)$ . Then  $X$  is irreducible between  $x$  and  $y$ . Since  $k(y)$  is dense in  $X$ , we have that  $x$  is a shore point.  $\square$

It is not difficult to see that the following proposition gives a sufficient condition for a continuum to be an arvum continuum.

**Proposition 3.2.** *Let  $X$  be a continuum. If, for every  $\varepsilon > 0$ , there are two disjoint subsets  $A$  and  $B$  of  $X$  such that  $H(A, X) < \varepsilon$  and  $H(B, X) < \varepsilon$ , then  $X$  is an arvum continuum.*

With the same argument that we use in Lemma 2.4, we could obtain the following lemma.

**Lemma 3.3.** *Let  $X$  be an arcwise connected continuum and  $z \in X$ . If  $X \setminus \overline{Q_z(y)}$  is empty for some  $y \in X \setminus \{z\}$ , then  $z$  is a shore point.*

**Proposition 3.4.** *Let  $X$  be an arcwise connected continuum. If  $X \setminus \overline{Q_z(y)}$  is empty for every pair  $z$  and  $y$  in  $X$ , then  $X$  is an arvum continuum.*

*Proof.* The proposition follows immediately from Lemma 3.3.  $\square$

**Corollary 3.5.** *If  $X$  is a dendroid and  $X \setminus \overline{Q_z(y)}$  is empty for every pair  $z$  and  $y$  in  $X$ , then  $X$  is an arvom dendroid.*

**Proposition 3.6.** *If  $X$  is an arcwise connected continuum without center points, then  $X$  is an arvom continuum.*

*Proof.* The proposition follows immediately from Theorem 2.5.  $\square$

#### 4. QUESTIONS

In this small section, we present some questions related to this paper.

**Question 4.1.** Is it true that if  $A$  is a shore set of a dendroid  $D$ , then  $\text{Int}(T(A)) = \emptyset$ .

**Question 4.2.** For a closed subset  $A$  of a continuum  $X$ , when is  $T(A)$  a shore set of  $X$ ?

**Question 4.3.** For a shore set  $A$  of a continuum  $X$ , when is  $T(A)$  a shore set of  $X$ ?

**Question 4.4.** What continua without cut points have center points?
