## PROPERTIES AND SUPER PROPERTIES

JOAN E. HART AND KENNETH KUNEN

ABSTRACT. The paper [2] discussed the properties HS and HL, related properties HC and HG, and the corresponding *strong* properties stHS, stHL, stHC, stHG. Here we explore the *super* properties suHS, suHL, suHC, suHG.

### 1. INTRODUCTION: THE SUPER IDEA

All topological spaces considered in this paper are  $T_3$  (Hausdorff and regular). The notions of a space being HS (hereditarily separable) and HL (hereditarily Lindelöf) are standard in the literature. The paper [2] introduced the names HC and HG for two related properties; these two concepts also occur in the literature, but under different names. The four properties HS, HL, HC, HG, whose definitions are recalled below, are related by the implications:

The corresponding *strong* properties stHC, stHS, stHL, stHG were also discussed in [2]. As usual, if  $\mathcal{P}$  is a property of spaces, then  $X$  is *strongly*  $\mathcal{P}$  (st $\mathcal{P}$ ) iff all finite powers of  $X$  have  $\mathcal{P}$ . Now we shall introduce the four *super* properties suHC, suHS, suHL, suHG. The definitions of the strong and super properties yield the implications:
