ON THE RECENT DEVELOPMENT OF THE NIELSEN FIXED POINT THEOREMS OF FIBER-PRESERVING MAPS

Jingyal Pak

1. Introduction

Let $f: X \rightarrow X$ be a continuous map on a compact connected ANR X into itself. The Nielsen fixed point theorem says that every map $g: X \rightarrow X$ homotopic to f has at least $N(f)$, the Nielsen number of f , fixed points. Thus the Nielsen fixed point theorem is more powerful than the Lefschetz fixed point theorem which only ensures the existence of a single fixed point if the Lefschetz number of f , $L(f) \neq 0$. If $L(f) = 0$ then no conclusion can be drawn as to whether or not there exists a fixed point. In fact, recently McCord [9] has constructed a homeomorphism h on a manifold M^n onto itself such that $L(h) = 0$ and $N(h) \geq 2$ in all dimensions n .

The purpose of this paper is to introduce recent developments of the product theorems for the Nielsen numbers of a fiber-preserving map. For the convenience of readers we introduce the Nielsen fixed point theorems from [1] and [4] in section 2. In the third section we study the Jiang's contribution [8] to estimate the Nielsen numbers of a continuous map. In the fourth section we cover some recent results dealing with the product theorems of the Nielsen number of a fiber-preserving map. In particular, we show that the recent product theorem of Giessmann [6] reduces to that of Pak [11].

There are a couple of excellent articles on the Nielsen fixed point theorems by Brown [1] and Fadell [4]. Therefore, we suggest to the readers to these publications for more materials and details with regard to the sections 2 and 3.

2. The Nielsen Fixed Point Theorems

Let $f: X \rightarrow X$ be a continuous map on a compact connected ANR X into itself. Let $\Phi(f) = \{x \in X \mid f(x) = x\}$ be the set of all fixed points of f . Any two elements $x, y \in \Phi(f)$ are said to be f -equivalent if there is a path $C: I \rightarrow X$ such that $C(0) = x$, $C(1) = y$, and $C \simeq f(C)$ (homotopic). This relation is an equivalence relation in $\Phi(f)$ and divides $\Phi(f)$ into finite number of equivalence classes F . If the fixed point index $i(F) \neq 0$ then F is called essential Nielsen fixed point class and if $i(F) = 0$ then F is called inessential. It is known that if $i(F) = 0$ then we could remove the fixed points in F by a map g homotopic to f in many cases.

Definition. The Nielsen number $N(f)$ of a map f is defined to be the number of essential fixed point classes of f .

Theorem [Nielsen]. Let $f: X \rightarrow X$ be a continuous map from a compact connected ANR X into itself. If $N(f) \neq 0$ then every map $g: X \rightarrow X$ homotopic to f has at least $N(f)$ fixed points.

In many cases, stronger conclusions can be drawn. For example, if X is a manifold of dimension ≥ 3 then there is a map g homotopic to f which has exactly $N(f)$ fixed points.

3. On the Jiang Spaces

In an effort to compute the Nielsen number of a given map $f: X \rightarrow X$, Jiang [8] introduced an interesting subgroup of the fundamental group of X . Let $M(X)$ be the space of all continuous maps from a compact connected ANR X into itself with compact open topology. Let $\alpha: M(X) \rightarrow X$ be a map defined by $\alpha(f) = f(x_0)$, i.e., the evaluation map at $x_0 \in X$. Then α induces $\alpha_{\#}: \pi_1(M(X), f) \rightarrow \pi_1(X, f(x_0))$. The Jiang subgroup $T(X, f, x_0)$ of f is defined to be the image $\alpha_{\#}(\pi_1(M(X), f))$ in $\pi_1(X, f(x_0))$. If we denote $T(X)$ for $T(X, \text{id}, x_0)$, then $T(X) \subset T(X, f, x_0) \subset \pi_1(X, f(x_0))$ for all $f \in M(X)$. It is known that $T(X)$ lies in the center of $\pi_1(X, x_0)$ and if $T(X) = \pi_1(X, x_0)$ then $\pi_1(X, x_0)$ abelian, and X said to satisfy the Jiang condition (J-condition). It is well known lens spaces and H-spaces satisfy the J-condition.

Theorem [Jiang]. If X satisfies the J-condition then each Nielsen fixed point class F of f has the same fixed point index $i(F)$ and if we denote this number by $i(f)$ then $L(f) = i(f) \cdot N(f)$.

Definition. Let $f_{\#}: \pi_1(X, x_0) \rightarrow \pi_1(X, x_0)$ be a homomorphism. Two elements α and β are said to be f -equivalent if there exists $\gamma \in \pi_1(X, x_0)$ such that $\alpha = \gamma \beta f_{\#}(\gamma^{-1})$. The Riedeweister number $R(f)$ of f is defined to be the cardinality of the set of equivalence classes in $\pi_1(X, x_0)$.

We apply the f -equivalence relation to $T(f)$ and denote the cardinality of equivalence classes by $J(f)$.

Theorem [Brooks, Brown, Jiang]. Assume $L(f) \neq 0$. Then

$$J(f) \leq N(f) \leq R(f).$$

Theorem [Jiang]. Assume $L(f) \neq 0$. If $T(X) = \pi_1(X)$, then $N(f) = J(f) = R(f)$.

4. On the Fiber-Preserving Maps

To compute the Nielsen number of a given map f , Brown [2] initially studied fiber-preserving maps. Let $J = \{E, p, B\}$ be an orientable Hurewicz fibering with a regular lifting function λ . If $f: E \rightarrow E$ is a fiber-preserving map then f induces $f': B \rightarrow B$ and $f_b: P^{-1}(b) \rightarrow P^{-1}(b)$ defined by $f_b(e) = \lambda(e, w)(1)$ where w is a path from $f(b)$ to $b \in B$. It is well known that $N(f_b)$ is independent of the choice of w and $b \in B$. The product theorem for the Nielsen number of a fiber-preserving map says $N(f) = N(f') \cdot N(f_b)$, $b \in B$, under the suitable conditions. Thus for a class of fiber-preserving maps we may compute the Nielsen number through the product theorem. Note that $L(f) = L(f') \cdot L(f_b)$ holds for all $b \in B$.

Theorem [Brown-Fadell]. Let $J = \{E, p, B\}$ be an orientable Hurewicz fibering with fiber Y where E , B and Y are connected finite polyhedra and let $f: E \rightarrow E$ be a fiber-preserving map. If one of the following conditions is satisfied

$$a) \pi_1(B) = \pi_2(B) = 0$$

$$b) \pi_1(Y) = 0$$

$$c) J \text{ is trivial and either } \pi_1(B) = 0 \text{ or } f = f' \times f_b$$

then $N(f) = N(f') \cdot N(f_b)$ for all f_b , $b \in B$.

Recently Fadell [5] came up with a unifying theorem for a number of existing theorems.

Theorem [Fadell]. Let $J = \{E, p, B\}$ be an orientable Hurewicz fibering with E , B and Y compact connected ANR's and let $f: J \rightarrow J$ be a fiber-preserving map. Suppose f and J satisfy the following conditions:

a) The sequence

$$0 \rightarrow \pi_1(Y) \xrightarrow{i_{\#}} \pi_1(E) \xrightarrow{p_{\#}} \pi_1(B) \rightarrow 0$$

is exact,

b) $p_{\#}$ admits a right inverse $\sigma: \pi_1(B) \rightarrow \pi_1(E)$ such that if $H = \text{im } \sigma$, then H is normal in $\pi_1(E)$ and $f_{\#}(H) \subset H$. Then $N(f) = N(f') \cdot N(f_b)$, $b \in B$.

If spaces involved in J satisfy the Jiang condition then we have a complete solution to the product theorem. Without loss of generality we may assume $L(f) \neq 0$. Consider the following part of fiber homotopy exact sequence:

$$\begin{array}{ccc} \pi_1(P^{-1}(b)) & \xrightarrow{i_{\#}} & \pi_1(E) \\ 1-f_{b\#} \downarrow & & 1-f_{\#} \downarrow \\ \pi_1(P^{-1}(b)) & \xrightarrow{i_{\#}} & \pi_1(E) \end{array}$$

This diagram induces a homomorphism

$$i_{\#}: \text{coker}(1-f_{\#}) \rightarrow \text{coker}(1-f_{b\#}).$$

Definition. Define $P(f)$ to be the order of $\ker i_{\#}$.

Theorem [Pak]. Let $J = \{E, p, B\}$ be an orientable Hurewicz fibering. We assume E , B and Y satisfy the J-condition. If $f: J \rightarrow J$ is a fiber-preserving map then $N(f) \cdot P(f) = N(f') \cdot N(f_b)$, $b \in B$.

The fiber homotopy exact sequence induces the following diagram:

$$\begin{array}{ccccccccccc}
K: & 0 & \rightarrow & K_4 & \rightarrow & K_3 & \rightarrow & K_2 & \rightarrow & K_1 & \rightarrow & 0 \\
& & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \\
& 0 & \rightarrow & d_{\#}(\pi_2(B)) & \xrightarrow{d_{\#}} & \pi_1(P^{-1}(b)) & \rightarrow & \pi_1(E) & \rightarrow & \pi_1(B) & \rightarrow & 0 \\
& & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \\
& 0 & \rightarrow & d_{\#}(\pi_2(B)) & \xrightarrow{d_{\#}} & \pi_1(P^{-1}(b)) & \rightarrow & \pi_1(E) & \rightarrow & \pi_1(B) & \rightarrow & 0 \\
& & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \\
C: & 0 & \rightarrow & C_4 & \xrightarrow{\alpha} & C_3 & \xrightarrow{i^{\#}} & C_2 & \xrightarrow{\gamma} & C_1 & \rightarrow & 0
\end{array}$$

$\downarrow \quad \downarrow \quad \downarrow \quad \downarrow \quad \downarrow$
 $1-f_{b\#} \quad 1-f_{\#} \quad 1-f'_{\#}$

where K = kernel and C = cokernel of corresponding maps, and $d_{\#}: \pi_2(B) \rightarrow \pi_1(P^{-1}(b))$ the connecting homomorphism. The sequence C is right exact, i.e., exact at C_1 and C_2 and K is left exact, i.e., exact at K_4 and K_3 . Also the homology groups satisfy $H(C_3) = H(K_1)$ and $H(C_4) = H(K_2)$. Let us denote the order of a group G by $0(G)$.

In an effort to generalize Pak's theorem Giessmann [6] proved the following theorem.

Theorem [Giessmann]. Let $J = \{E, p, B\}$ be an orientable Hurewicz fibering. Let $f: J \rightarrow J$ be a fiber-preserving map. If E satisfies J -condition and if $\text{Im}(1-f_{b\#})$ and $\text{Im}(1-f'_{\#})$ lie in the corresponding Jiang subgroups $T(f_b)$ and $T(f')$ respectively then $N(f) \cdot Q(f) = N(f') \cdot N(f_b) \cdot R(f)$, where $Q(f) = 0(H(K_1)) \cdot 0(C_4)$ and $R(f) = 0(H(K_4))$.

Lemma 1. $0(C_2) \cdot P(f) = 0(C_1) \cdot 0(C_3)$.

Proof. The above diagram induced by the fiber homotopy exact sequence induces the following short exact sequences:

$$\begin{array}{ccccccc}
0 & \rightarrow & H(C_4) & \rightarrow & C_4 & \rightarrow & \text{Im } \alpha \rightarrow 0, \\
0 & \rightarrow & \ker i^{\#} & \rightarrow & C_3 & \rightarrow & \text{Im } i^{\#} \rightarrow 0, \\
0 & \rightarrow & \ker \gamma & \rightarrow & C_2 & \rightarrow & C_1 \rightarrow 0, \text{ and}
\end{array}$$

we have

$$0 \rightarrow \ker i^\# \rightarrow C_3 \rightarrow \ker \gamma \rightarrow C_2 \rightarrow C_1 \rightarrow 0.$$

From the above exact sequences we can read off

$$\begin{aligned} 0(C_4) &= 0(H(C_4)) \cdot 0(\operatorname{Im} \alpha), \\ 0(C_3) &= 0(\ker i^\#) \cdot 0(\operatorname{Im} i^\#), \\ 0(C_3) &= 0(C_1) \cdot 0(\ker \gamma) \text{ and} \end{aligned}$$

we have

$$\begin{array}{ccc} 0(C_3) & = 0(\operatorname{Im} i^\#) = 0(\ker \gamma) = 0(C_2) & \\ \swarrow & & \searrow \\ 0(\ker i^\#) & & 0(C_1). \end{array}$$

Therefore we get $0(C_2) \cdot 0(\ker i^\#) = 0(C_1) \cdot 0(C_3)$. Since $P(f) = 0(\ker i^\#)$ our lemma is proved.

Theorem 2. Let $J = \{E, p, B\}$ be an orientable Hurewicz fibering and let $f: J \rightarrow J$ be a fiber-preserving map such that $L(f) \neq 0$. If E satisfies the J -condition and if $\operatorname{Im}(1-f_{b\#})$ and $\operatorname{Im}(1-f'_\#)$ lie in the corresponding Jiang subgroups $T(f_b)$ and $T(f')$, then $N(f) \cdot P(f) = N(f') \cdot N(f_b)$, $b \in B$.

Proof. Giessmann's theorem says $N(f) \cdot Q(f) = N(f') \cdot N(f_b) \cdot R(f)$. Since we know $0(H(K_2)) = 0(H(C_4))$ and $0(H(K_1)) = 0(H(C_3))$ we have $N(f) \cdot 0(H(C_3)) \cdot 0(C_4) = N(f_b) \cdot N(f') \cdot 0(H(C_4))$. From the proof of lemma 1, we have $N(f) \cdot 0(H(C_3)) \cdot 0(H(C_4)) \cdot 0(\operatorname{Im} \alpha) = N(f_b) \cdot N(f') \cdot 0(H(C_4))$, and this reduced to $N(f) \cdot 0(\frac{\ker i^\#}{\operatorname{Im} \alpha}) \cdot 0(\operatorname{Im} \alpha) = N(f_b) \cdot N(f')$. Thus we conclude $N(f) \cdot P(f) = N(f') \cdot N(f_b)$, $b \in B$.

Finally we would like to pose a couple of problems.

Problem 1. If $E = B \times Y$, then Gottlieb [7] has shown that E satisfies the J -condition iff B and Y satisfy the

J-condition. Derivation of theorem 2 from that of Giessmann strongly suggests the following problem:

Let $J = \{E, p, B, Y\}$ be an orientable Hurewicz fibering. Then E satisfies the J-condition iff B and Y satisfy the J-condition.

Problem 2. It is known that simply connected spaces, lens spaces, and H-spaces satisfy the J-condition. It will be an interesting problem to try to enlarge the class of Jiang spaces.

Added in Proof. Recently we have shown "only if" part of problem 1. That is if E satisfies J-condition then B and Y satisfy the J-condition. This result gives:

Theorem 3. Let $J = \{E, p, B\}$ be an orientable Hurewicz fibering, where E satisfies the J-condition. If $f: J \rightarrow J$ is a fiber-preserving map such that $L(f) \neq 0$, then $N(f) \cdot P(f) = N(f') \cdot N(f'_b)$, $b \in B$.

A proof of this theorem also follows easily from the following theorem of Fadell [5]. We leave the proof to the reader.

Theorem [Fadell]. Let $J = \{E, p, B\}$ be a Hurewicz fibering with E and B compact, metric ANR's and $f: E \rightarrow E$ a fiber-preserving map. Then there is a locally trivial fibering $J' = \{E', p', B'\}$ with fiber F' and a fiber-preserving map $g: E' \rightarrow E'$ with the following properties:

- 1) B' and F' are compact polyhedra,
- 2) $g': B' \rightarrow B'$ has precisely $N(g')$ fixed points, each

in a maximal simplex,

- 3) For each $b \in \Phi(g')$, $g_b: F' \rightarrow F'$ has precisely $N(g_b)$ fixed points, each in a maximal simplex of F' ,
- 4) $N(f) = N(g)$, $N(f') = N(g')$, and $N(f_b) = N(g_b)$.

This theorem implies that without loss of generality we may assume f has all the properties of g . Let $\{F_1, \dots, F_k\} = \Phi'(f)$ be the Nielsen fixed point classes of f . If $\ell_{i,1}$ and $\ell_{i,2} \in F_i$ then $P(\ell_{i,1}) \sim P(\ell_{i,2})$ in B and from the fact that f' has exactly $N(f')$ fixed points we deduce that all points in F_i lie in the same fiber say $P^{-1}(b)$. Let $F_i \cap P^{-1}(b) = \{\ell_{i,1}, \dots, \ell_{i,k_i}\}$. Define a map $\gamma: \Phi'(f_b) \rightarrow \Phi'(f)$ for each $b \in B$ by $\gamma(\ell_{i,j}) = F_i$. This is a well-defined map. Let $P(f)_{F_i} = \#(\gamma^{-1}(F_i)) = k_i$. Then the following theorem follows easily.

Theorem 4. Let $J = \{E, p, B\}$ be an orientable Hurewicz fibering and $f: E \rightarrow E$ a fiber-preserving map. If $P(f) = \#(\gamma^{-1}(F_i))$ is a constant for each i , then $N(f) \cdot P(f) = N(f') \cdot N(f_b)$, $b \in B$.

Finally I would like to state a recent theorem from [15].

Theorem 5. Let $J = \{E, p, B\}$ be an orientable Hurewicz fibering and $f: E \rightarrow E$ a fiber-preserving map such that $L(f) \neq 0$. If the fundamental groups of the spaces involved in J are abelian then $N(f) \cdot p(f) = N(f') \cdot N(f_b)$, $b \in B$.

Note that this theorem improves theorem 3.
