## EMBEDDING FINITE COVERING SPACES INTO BUNDLES

P. F. Duvall and L. S. Husch<sup>1</sup>

### 1. Introduction

In [H], Hansen shows that if  $X$  has the homotopy type of a CW-complex of dimension  $\ell \geq 1$  and if  $p: \tilde{X} \rightarrow X$  is a finite covering map, then there exists an embedding  $g: \tilde{X} \rightarrow X \times \mathbf{R}^{\ell+1}$  such that  $\rho g = p$  where  $\rho: X \times \mathbf{R}^{\ell+1} \rightarrow X$  is projection and  $\mathbf{R}^{\ell+1}$  is Euclidean  $(\ell+1)$ -space. He shows that this is the best possible result for trivial bundles since when the standard 2-fold covering,  $p: S^\ell \rightarrow \mathbf{RP}^\ell$ , of the real projective  $\ell$ -space is considered, there exists no embedding  $g: S^\ell \rightarrow \mathbf{RP}^\ell \times \mathbf{R}^\ell$  such that  $\rho g = p$ . We extend this result as follows.

*Theorem 1. Let  $X$  be a connected, topological space with the homotopy type of a locally finite simplicial complex of dimension  $\ell$ . Let  $p: \tilde{X} \rightarrow X$  be a finite  $n$ -fold covering map and let  $f: V \rightarrow X$  be an  $\mathbf{R}^k$ -bundle over  $X$ . If  $k > \ell$ , then there exists an embedding  $g: \tilde{X} \rightarrow V$  such that  $f \circ g = p$ .*

The proof of Theorem 1 reduces to showing the existence of a cross-section of a certain bundle over  $X$  with fiber  $C_n(\mathbf{R}^k)$ , the configuration space of  $n$  unordered points in  $\mathbf{R}^k$ . As a result, we also obtain the following.

*Theorem 2. Let  $X, p, f$  be as in Theorem 1. If*

---

<sup>1</sup>Research of both authors was supported in part by an N.S.F. grant.

$k = \ell \geq 4$ , then there exists a unique obstruction in  $H^k(X; \hat{\pi}_{k-1}(C_n(\mathbb{R}^k)))$ , the  $k^{\text{th}}$  cohomology group of  $X$  with local coefficients (in the sense of [B]) whose vanishing is a necessary and sufficient condition that there exists an embedding  $g: \tilde{X} \rightarrow V$  such that  $f \circ g = p$ .

In [D-H], we show that if  $X$  is a closed orientable manifold of even dimension  $k > 2$  and if  $f: V \rightarrow X$  is an orientable  $\mathbb{R}^k$ -bundle over  $X$ , then the obstruction is the Euler class of the bundle  $f: V \rightarrow X$ . Results of this type have consequences in embedding  $k$ -dimensional compacta up to shape in Euclidean  $2k$ -space,  $\mathbb{R}^{2k}$ .

## 2. Preliminaries

$f: V \rightarrow X$  is an  $\mathbb{R}^k$ -bundle if  $f$  is a bundle in the sense of [S]. In particular,  $f$  is a locally trivial map. We shall suppress the structure group which could be some subgroup of the group of homeomorphisms of  $\mathbb{R}^k$  with the compact-open topology.

Let  $F_n(\mathbb{R}^k) = \{(x_1, x_2, \dots, x_n) \in (\mathbb{R}^k)^n \mid x_i \neq x_j \text{ for } i \neq j\}$ . The symmetric group on  $n$  symbols,  $\Sigma_n$ , acts freely on  $F_n(\mathbb{R}^k)$  by permutation of coordinates: if  $\sigma \in \Sigma_n$ , then  $\sigma(x_1, x_2, \dots, x_n) = (x_{\sigma(1)}, x_{\sigma(2)}, \dots, x_{\sigma(n)})$ . Let  $C_n(\mathbb{R}^k) = F_n(\mathbb{R}^k)/\Sigma_n$  be the orbit space of the action.

Two covering spaces  $p_i: \tilde{X}_i \rightarrow X$  are equivalent if there exists a homeomorphism  $h: \tilde{X}_1 \rightarrow \tilde{X}_2$  such that  $p_2 \circ h = p_1$ .

Let  $f: V \rightarrow X$  be an  $\mathbb{R}^k$ -bundle and let  $p: \tilde{X} \rightarrow X$  be an  $n$ -fold covering of  $X$ . Let  $f_{(n)}: V_{(n)} \rightarrow X$  be the  $n$ -fold Whitney sum of  $f$ ; i.e. consider the  $n$ -fold product bundle

$f_X \cdots f_X: V_X \cdots X_V \rightarrow X_X \cdots X_X$  and let  $f_{(n)}: V_{(n)} \rightarrow X$  be the pullback of the latter bundle induced by the diagonal map  $X \rightarrow X_X \cdots X_X$ .  $V_{(n)} = \{(x, (v_1, \dots, v_n)) \in X_X V_X \cdots X_V \mid f(v_1) = f(v_2) = \dots = f(v_n) = x\}$ . Let  $\nabla = \{(x, (v_1, \dots, v_n)) \in V_{(n)} \mid v_i = v_j \text{ for some } i \neq j\}$  and let  $F_n(V) = V_{(n)} \setminus \nabla$ . It is easily checked that  $\alpha = \{f_{(n)} \mid F_n(V): F_n(V) \rightarrow X\}$  is a bundle over  $X$  whose fiber is  $F_n(\mathbb{R}^k)$ .

The symmetric group  $\Sigma_n$  acts freely on  $F_n(V)$ : if  $\sigma \in \Sigma_n$ , define  $\sigma_*$  on  $F_n(V)$  by  $\sigma_*(x, (v_1, \dots, v_n)) = (x, (v_{\sigma(1)}, \dots, v_{\sigma(n)}))$ . Let  $C_n(V) = F_n(V)/\Sigma_n$  be the orbit space of this action and let  $\tau: F_n(V) \rightarrow C_n(V)$  be the natural mapping. Since  $\alpha \circ \sigma_* = \alpha$  for all  $\sigma \in \Sigma_n$ , we have an induced bundle mapping  $\beta: C_n(V) \rightarrow X$  whose fiber is  $C_n(\mathbb{R}^k)$ .

Let  $\Sigma'_{n-1} = \{\sigma \in \Sigma_n \mid \sigma(1) = 1\}$ , let  $E_n(V) = F_n(V)/\Sigma'_{n-1}$  be the orbit space of this subaction and let  $\mu: F_n(V) \rightarrow E_n(V)$  be the natural mapping. Let  $\gamma: E_n(V) \rightarrow X$  be the induced bundle mapping. Note that we have an induced map  $\rho: E_n(V) \rightarrow C_n(V)$  which is an  $n$ -fold covering map [M-Z, p. 235].

We have the following analogue of Proposition 3.1 of [H].

*Proposition 3. There exists an embedding  $g: \tilde{X} \rightarrow V$  such that  $fg = p$  if and only if there exists a section  $\vartheta: X \rightarrow C_n(V)$ , of  $\beta$  (i.e.  $\beta\vartheta = 1_X$  identity on  $X$ ) such that the pullback of  $\rho: E_n(V) \rightarrow C_n(V)$  by  $\vartheta$  is equivalent to  $p$ .*

*Proof.* Let  $g: \tilde{X} \rightarrow V$  be an embedding such that  $fg = p$ . Let  $x \in X$  and let  $p^{-1}(x) = \{x_1, \dots, x_n\}$ . Define  $\vartheta(x) = \tau(x, (g(x_1), g(x_2), \dots, g(x_n)))$ ; note that  $\vartheta$  is well-defined.

We leave to the reader to supply the straightforward argument to show that  $\vartheta$  is continuous, and, hence, a section of  $\beta$ .

Let

$$\begin{array}{ccc}
 E & \xrightarrow{\vartheta'} & E_n(V) \\
 \rho' \downarrow & & \downarrow \rho \\
 X & \xrightarrow{\vartheta} & C_n(V)
 \end{array}$$

be the pullback diagram where  $E = \{(x, y) \in X \times E_n(V) \mid \vartheta(x) = \rho(y)\}$ . Define  $h: \tilde{X} \rightarrow E$  by  $h(y) = (p(y), \mu(p(y), (g(y), g(y_2), \dots, g(y_n))))$  where  $p^{-1}p(y) = \{y, y_2, \dots, y_n\}$ . Again it is straightforward to check that  $h$  is a continuous map and that the inverse of  $h$  is given by

$$h^{-1}(x, \mu(x, (v_1, \dots, v_n))) = g^{-1}(v_1).$$

Note that  $\rho'h(x) = p(x)$ ; hence, the covering spaces  $p: \tilde{X} \rightarrow X$  and  $\rho': E \rightarrow X$  are equivalent.

Now suppose that the section  $\vartheta: X \rightarrow C_n(V)$  exists so that there exists a homeomorphism  $h: \tilde{X} \rightarrow E$  with  $\rho'h = p$  where  $\rho': E \rightarrow X$  is the pullback of  $\rho$  by  $\vartheta$ . Define  $\lambda: E_n(V) \rightarrow V$  by  $\lambda(\mu(x, (v_1, v_2, \dots, v_n))) = v_1$ ; note that  $\lambda$  is a continuous map such that  $f\lambda = \gamma$ . Define  $g: \tilde{X} \rightarrow V$  by  $g(x) = \lambda \vartheta'h(x)$ . Note that  $fg = f\lambda \vartheta'h = \gamma \vartheta'h = \beta\rho \vartheta'h = \beta \vartheta \rho'h = p$ ; hence  $g$  is "fiber-preserving." In order to show that  $g$  is one-to-one, suppose that  $g(x) = g(y)$ ; thus  $p(x) = p(y)$ . If

$$h(x) = (p(x), \mu(x', (v_1, \dots, v_n)))$$

and

$$h(y) = (p(y), \mu(y', (w_1, \dots, w_n))),$$

then, from the definition of pullback,  $\vartheta(p(x)) =$

$\rho\mu(x', (v_1, \dots, v_n))$  and

$$p(x) = \beta\theta p(x) = \beta\rho\mu(x', (v_1, \dots, v_n)) = \alpha(x', (v_1, \dots, v_n)) = x'$$

Similarly,  $p(y) = y'$ . Since  $\theta p = \theta\rho'h = \rho\theta'h$  and

$\tau = \rho\mu$ ,  $\{v_1, \dots, v_n\} = \{w_1, \dots, w_n\}$ . Also,  $g(x) = \lambda\theta'h(x) = \lambda(\mu(x', (v_1, \dots, v_n))) = v_1$  and  $g(y) = w_1$ , similarly. Hence,  $h(x) = h(y)$  and since  $h$  is one-to-one,  $x = y$ .  $g$  is the desired embedding.

Consider the following commutative diagram:

$$\begin{array}{ccccc}
 \pi_1 F_n(\mathbb{R}^k) & \longrightarrow & \pi_1 C_n(\mathbb{R}^k) & \xrightarrow{\partial_1'} & \Sigma_n & \longrightarrow & 1 \\
 \downarrow & & \downarrow & & \parallel & & \\
 \pi_1 F_n(V) & \xrightarrow{\tau_*} & \pi_1 C_n(V) & \xrightarrow{\partial_1} & \Sigma_n & \longrightarrow & 1 \\
 \downarrow \alpha_* & & \downarrow \beta_* & & & & \\
 \pi_1 X & \xlongequal{\quad} & \pi_1 X & & & & \\
 \downarrow & & \downarrow & & & & \\
 1 & & 1 & & & & 
 \end{array}$$

where the rows and columns are from the exact sequences of bundles and covering spaces.

*Lemma 4.* If  $k \geq 3$ , then  $\beta_* \times \partial_1: \pi_1 C_n(V) \rightarrow \pi_1 X \times \Sigma_n$  is an isomorphism whose inverse is given by

$$(\beta_* \times \partial_1)^{-1}(z_1, z_2) = \tau_* \alpha_*^{-1}(z_1) \cdot j_*(\partial_1')^{-1}(z_2).$$

*Proof.* If  $k \geq 3$ , then  $\pi_1 F_n(\mathbb{R}^k) = 1$  [F-N] and, hence,  $\alpha_*$  is an isomorphism. The rest of the proof is a straightforward diagram chasing argument.

In the proof of the latter lemma, one shows the following.

*Lemma 5.* If  $k \geq 3$ , then  $j_*$  is one-to-one.

### 3. Characteristic Maps for n-Fold Covering Maps

Let  $q: \tilde{Y} \rightarrow Y$  be an n-fold covering map,  $y_0 \in Y$  and let  $q^{-1}(y_0) = \{y_1, \dots, y_n\}$ . Let  $k: [0,1] \rightarrow Y$  represent an element of  $\pi_1(Y, y_0)$  and let  $k_i: [0,1] \rightarrow \tilde{Y}$  be a lifting of  $k$  so that  $k_i(0) = y_i$ . Let  $\sigma \in \Sigma_n$  be such that  $k_i(1) = y_{\sigma(i)}$ . Let  $\chi(q): \pi_1(Y, y_0) \rightarrow \Sigma_n$  be the homomorphism defined by  $\chi(q)[k] = \sigma$ ;  $\chi(q)$  is called a *characteristic map* for  $q$ , [S] [H].  $\chi(q)$  depends upon the ordering of  $q^{-1}(y_0)$  and is well-defined up to conjugacy class; i.e. if  $\chi'(q)$  is defined by using a different ordering, then there exists  $\sigma_0 \in \Sigma_n$  such that  $\chi(q)(\alpha) = \sigma_0[\chi'(q)(\alpha)]^{-1}\sigma_0$  for all  $\alpha \in \pi_1(Y, y_0)$ . Characteristic maps determine the n-fold coverings of  $Y$ : two n-fold coverings  $q_i: \tilde{Y}_i \rightarrow Y$  are equivalent if and only if their characteristic maps are conjugate.

*Proposition 6.* The boundary homomorphism  $\partial_1: \pi_1 C_n(V) \rightarrow \Sigma_n$  from the long exact homotopy sequence of the fiber space  $\tau: F_n(V) \rightarrow C_n(V)$  is a characteristic map for the covering  $\rho: E_n(V) \rightarrow C_n(V)$ .

*Proof.* Let  $v_0$  be the base point of  $C_n(V)$  and let us identify  $\tau^{-1}(v_0) = \Sigma_n$ . Consider the cosets of  $\Sigma'_{n-1}$  in  $\Sigma_n$ ,  $\{w_1 \Sigma'_{n-1}, w_2 \Sigma'_{n-1}, \dots, w_n \Sigma'_{n-1}\}$ , where  $w_1 = \text{identity}$  and  $w_i$  is a permutation such that  $w_i(1) = i$ . Let  $k: [0,1] \rightarrow C_n(V)$  represent an element of  $\pi_1(C_n(V), v_0)$ . Choose liftings  $\tilde{k}_i: [0,1] \rightarrow F_n(V)$  such that  $\tilde{k}_i(0) = w_i$ .

Recall that the long exact homotopy sequence of the fiber space  $\tau: F_n(V) \rightarrow C_n(V)$  is obtained from the long exact homotopy sequence of the pair  $(F_n(V), \Sigma_n = \tau^{-1}(v_0))$  using the isomorphism  $\tau_*: \pi_*(F_n(V), \Sigma_n; w_1) \rightarrow \pi_*(C_n(V), v_0)$ . In order

to determine  $\partial_1([k])$ , we consider the class of  $[\tilde{k}_1] \in \pi_1(F_n(V), \Sigma_n; w_1)$ ; then  $\partial_1([k]) = \tilde{k}_1(1) \equiv \sigma$ .

Since  $\tau$  is a principal  $\Sigma_n$ -bundle,  $\tilde{k}_1(1) = \sigma \circ w_1$ . Consider  $k_i = \mu \circ \tilde{k}_i$ ;  $k_i(0) = \mu(w_i) \equiv v_i$ . Note that  $\rho^{-1}(v_0) = \{v_1, v_2, \dots, v_n\}$  and that  $k_i(1) = \mu \tilde{k}_i(1) = \mu(\sigma \circ w_i) = \mu(w_{\sigma(i)}) = v_{\sigma(i)}$  since  $\sigma \circ w_i(1) = \sigma(i)$ . Hence,  $\partial_1$  is a characteristic map for  $\rho$ .

The proof of the following is straightforward.

*Proposition 7.* Let  $\rho: \tilde{Y} \rightarrow Y$  be an  $n$ -fold covering map and let  $\alpha: Z \rightarrow Y$  be a continuous map. Then  $\chi(\tilde{\rho}) = \chi(\rho) \circ \alpha_*$  is a characteristic map for the pullback  $\tilde{\rho}: \tilde{Z} \rightarrow Z$ .

*Lemma 8.* If  $k \geq 3$ , there exists a homomorphism  $\lambda: \pi_1 X \rightarrow \pi_1 C_n(V)$  such that  $\beta_* \lambda = \text{identity}$  and  $\chi(p) = \partial_1 \lambda$ .

*Proof.* Define

$$\begin{aligned} \lambda(z) &= (\beta_* \times \partial_1)^{-1}(z, \chi(p)(z)) \\ &= \tau_* \alpha_*^{-1}(z) \cdot j_* (\partial_1^!)^{-1}(\chi(p)(z)) \text{ [cf. Lemma 4].} \end{aligned}$$

Clearly  $\beta_* \lambda(z) = z$  and  $\chi(p)(z) = \partial_1 \lambda(z)$ .

*Lemma 8'.* If  $X$  has the homotopy type of a locally finite 1-dimensional simplicial complex, then there exists a homomorphism  $\lambda: \pi_1 X \rightarrow \pi_1 C_n(V)$  such that  $\beta_* \lambda = \text{identity}$  and  $\chi(p) = \partial_1 \lambda$ .

*Proof.*  $\pi_1 X$  is free on generators  $\{x_i\}$ . Since  $\partial_1^!: \pi_1 C_n(\mathbb{R}^k) \rightarrow \Sigma_n$  is onto, there exists for each  $i$ ,  $y_i \in \pi_1 C_n(\mathbb{R}^k)$  such that  $\chi(p)(x_i) = \partial_1^!(y_i)$ . Since  $\alpha_*: \pi_1 F_n(V) \rightarrow \pi_1 X$  is onto, there exists for each  $i$ ,  $z_i \in \pi_1 F_n(V)$  such that  $\alpha_*(z_i) = x_i$ .

Define  $\lambda: \pi_1 X \rightarrow \pi_1 C_n(V)$  by

$$\lambda(x_i) = \tau_*(z_i) \cdot j_*(y_i).$$

$\lambda$  is the desired homomorphism.

**4. Proof of Theorem 1**

*Proposition 9.* Let  $X$  be a locally finite simplicial complex and suppose that  $k \geq 3$ ; then there exists a section  $\theta: X^{k-1} \rightarrow C_n(V)$  of  $\beta$  such that the pullback of  $\rho$  by  $\theta$  is equivalent to  $p|_p^{-1}(X^{k-1})$  where  $X^{k-1}$  is the  $(k-1)$ -skeleton of  $X$ .

*Proof.* For each vertex  $v \in X$ , choose a point  $\theta(v) \in \beta^{-1}(v)$ . Let  $T$  be a maximal tree in the 1-skeleton of  $X$ . Since the fiber of  $\beta$  is path-connected, we can extend  $\theta$  to a cross-section  $\theta$  over  $T$  as in [S; p. 148]. Recall the calculation of  $\pi_1(X, v_0)$  using edge-paths [H-W; p. 241]: order the vertices of  $X$ ,  $v_0, v_1, v_2, \dots$ . For each  $i$ , let  $e_i$  be an edge-path in  $T$  from  $v_0$  to  $v_i$ . We may assume that each  $e_i$  is an arc.

Let  $[v_i v_j]$  be a 1-simplex in  $X \setminus T$ ,  $i < j$ ;  $[v_i v_j]$  determines an element  $\xi_{ij}$  of  $\pi_1(X, v_0)$  which is given by the edge-loop  $e_i * v_i v_j * \bar{e}_j$ . Let  $F: \beta^{-1}(e_i \cup [v_i v_j]) \rightarrow (e_i \cup [v_i v_j]) \times C_n(\mathbb{R}^k)$  be a homeomorphism such that  $\rho_1 F = \beta$  where  $\rho_t$  denotes the projection of  $(e_i \cup [v_i v_j]) \times C_n(\mathbb{R}^k)$  onto the  $t^{\text{th}}$  factor.

Let  $K: [0, 1] \rightarrow [v_i v_j]$  be a homeomorphism such that  $K(0) = v_i, K(1) = v_j$  and let  $K': [0, 1] \rightarrow C_n(\mathbb{R}^k)$  be a path such that  $K'(0) = \rho_2 F \theta(v_i)$  and  $K'(1) = \rho_2 F \theta(v_j)$ .  $K'$  determines a path  $\check{K}$  in  $\beta^{-1}(e_i \cup [v_i v_j])$  defined by  $\check{K}(t) = F^{-1}(K(t), K'(t))$  and, hence, a loop  $\check{\xi}_{ij} = \theta(e_i) * K * \theta(\bar{e}_j)$  in  $C_n(V)$ . Note that  $\beta_*(\check{\xi}_{ij}) = \xi_{ij}$ . Let  $\lambda: \pi_1(X, v_0) \rightarrow \pi_1(C_n(V), \theta(v_0))$  be

the homomorphism obtained in Lemma 8. Consider the element  $\check{\xi}_{ij}^{-1} \lambda(\xi_{ij}) \in \pi_1(C_n(V), \emptyset(v_0))$ ; since  $\beta_*(\check{\xi}_{ij}^{-1} \lambda(\xi_{ij})) = 1$ ,  $\check{\xi}_{ij}^{-1} \lambda(\xi_{ij})$  lies in the image of  $\pi_1(C_n(\mathbb{R}^k))$  in  $\pi_1(C_n(V))$ . Hence, if we choose the path  $K'$  carefully, we can obtain  $\check{\xi}_{ij} = \lambda(\xi_{ij})$ . Extend  $\emptyset$  to  $[v_i v_j]$  by  $\emptyset(x) = \check{K}K^{-1}(x)$ .

If we perform this construction for each 1-simplex in  $X \setminus T$ , we obtain a section  $\emptyset$  defined on the 1-skeleton of  $X$  such that  $\emptyset_*$  takes the generators  $\xi_{ij}$  of  $\pi_1(X, v_0)$  to  $\lambda(\xi_{ij}) \in \pi_1(C_n(V), \emptyset(v_0))$ .

Let  $[v_i v_j v_k]$ ,  $i < j < k$ , be an ordered 2-simplex in  $X$ . Note that for one of the paths  $e_s \in \{e_i, e_j, e_k\}$ ,  $e_s \cap [v_i v_j v_k] = \{v_s\}$ . Suppose  $s = i$ . Let  $F: \beta^{-1}(e_i \cup [v_i v_j v_k]) \rightarrow (e_i \cup [v_i v_j v_k]) \times C_n(\mathbb{R}^k)$  be a homeomorphism such that  $\rho_1 F = \beta$ . Note that  $\Gamma = e_i \cup \text{bdry } [v_i v_j v_k]$  represents the loop  $\xi_{ij} \xi_{jk} \xi_{ik}$  which is trivial in  $X$ . Consider  $\emptyset_*(\Gamma) = \emptyset_*(\xi_{ij}) \emptyset_*(\xi_{jk}) \emptyset_*(\xi_{ik})^{-1} = \lambda(\xi_{ij}) \lambda(\xi_{ij}) \lambda(\xi_{ik})^{-1} = \lambda(\Gamma) = 1$ . By Lemma 5,  $\rho_1 F \emptyset(\Gamma)$  is homotopically trivial in  $C_n(\mathbb{R}^k)$ . By standard techniques [S; p. 149] we can extend  $\emptyset$  to a section over  $[v_i v_j v_k]$  and, hence, over the 2-skeleton  $X^2$  of  $X$ . Note that  $\emptyset_*: \pi_1(X^2) \rightarrow \pi_1(C_n(V))$  is the homomorphism  $\lambda j_*$  where  $j: X^2 \rightarrow X$  is inclusion.

If  $k \geq 4$ ,  $\pi_1(C_n(\mathbb{R}^k)) = 0$  for  $2 \leq i \leq k-2$  [F-N]; hence, by classical techniques [S]  $\emptyset$  extends to a section of  $X^{k-1}$  into  $C_n(V)$ .

Let  $\tilde{\rho}: \xi \rightarrow X^{k-1}$  be the pullback of  $\rho$  by  $\emptyset$ . A characteristic map for  $\tilde{\rho}$ ,  $\chi(\tilde{\rho}) = \chi(\rho) \circ \emptyset_*$  by Proposition 7; but  $\chi(\rho) = \partial_1$  by Proposition 6. Hence  $\chi(\tilde{\rho}) = \partial_1 \circ \emptyset_* = \partial_1 \circ \lambda \circ j_* = \chi(\rho) \circ j_*$  by Lemma 8. Again, by Proposition 7,

$\chi(p|p^{-1}(X^{k-1})) = \chi(p) \circ j_*$ . Hence,  $\tilde{\rho}$  and  $p|p^{-1}(X^{k-1})$  are equivalent.

If  $\ell \geq 2$ , then Propositions 3 and 9 yield Theorem 1. If  $\ell = 1$ , the following Proposition, whose proof is similar to the proof of Proposition 9, and Proposition 3 yield the remaining case of Theorem 1.

*Proposition 9'. Let  $X$  be a locally finite 1-dimensional simplicial complex; then there exists a section  $\emptyset: X \rightarrow C_n(V)$  of  $\beta$  such that the pullback of  $\rho$  by  $\emptyset$  is equivalent to  $p$  when  $V$  is an  $\mathbf{R}^2$ -bundle over  $X$ .*
